Free and open source photo editors Although you'll probably find few people who use free and open source photo editors, you have several options. I'll discuss four choices in this section. * **ImageJ:**

ImageJ is a very powerful program that is used to create, analyze, and visualize images and time-lapse videos. It offers a wide range of functions for image processing and image analysis. It's easy to use and can perform complex tasks. It's a Java-based program. Like most Java programs, it is slow to use, but the speed can be improved by installing the Java Runtime Environment (see Chapter 12). ImageJ is available free for Windows and Mac, and a source code version is available for Linux. *

ImageMagick: ImageMagick is a powerful open source program that is used for a wide range of

image processing and converting tasks. Its main feature is that it has a large library of command-line utilities that can be used in scripts

Association between cyclin D1 expression and overall survival rate (Log-rank) are known which can be used to interconnect ends of optical fibers. An optical connector can be referred to as an “optical adapter” which is used to connect ends of optical fibers and can be used to connect two optical fibers to an optical signal source, such as an optical network unit (ONU), a network terminal, or a switch. A reduction in the space required for an optical connector to mate with another optical connector is desirable in order to reduce costs associated with housing components of the optical connectors. As a result of advancements in very large scale integration (VLSI) technology, fiber optic cables, which include very small diameter optical

fibers, are now being used for optical networking applications, such as voice and video communications. Fiber optic cables typically include a series of optical connectors, which can be the ends of optical fibers, which can be mated or connected to optical signal sources. The optical connectors can be terminated at the ends of the optical fibers or at various positions along the lengths of the optical fibers, for example, for use as “pass-through” connectors in longer-length optical fibers. Various ways are known for terminating optical fibers to optical connectors, including techniques for terminating the optical fibers to optical connectors, methods for terminating the optical connectors to fiber optic cables, methods for terminating the fiber optic cables to other optical connectors, or methods for terminating optical connectors to fiber optic cable connectors. Examples of such techniques can be found in U.S. Pat. Nos. 5,425,676; 5,497,409; and 5,635,778. In optical fiber communications networks, the lengths of optical fibers are installed in channels in communication networks. For example,

one or more lengths of a communications channel can be made up of a group of optical fiber cables interconnected in a communications channel. The ends of the optical fibers (i.e., optical connectors) are terminated to each end of the optical fiber cables. For example, each end of a cable can have a corresponding optical connector, or each end of a group of cables can have a corresponding optical connector. The terminus of an optical connector can be a polished end face (PEF) of an optical fiber, which can be an angled end face or a planar end face. The connectors can be available as a trayless connector in a connector tray, and can have a form-fitting arrangement, an axial alignment arrangement
